Hi Eva,

Ken is out of the office. I checked in with Bob Zei at Forensic regarding your question. Bob indicated that they will deploy the transducers on Monday to support the pore-water study which will be conducted next week. The transducers will be removed at the completion of the pore-water work (expected to be complete on Friday next week). Bob also indicated that they expect the tidal data obtained to be sufficient to support the planned well construction in December.

Matt McClincy

Ken-

During our call, we talked about ensuring that water level observations in wells, including installing transducers, should start in October to allow for a series of readings before monitoring wells are installed and to record groundwater levels before, during and immediately after the porewater sampling. Will this be done? Thanks.

Eva

Eva,  
Thank you for this prompt response to the GS Roofing Supplemental Source Control Evaluation comments following our telephone project meeting October 9. Your comments provided today involve upland groundwater and the proposed additional monitoring wells. Monitoring well installation work at the site is currently slated for December 2015. Today's responses can be carefully considered and addressed prior to that time.

Pore water and sediment sampling on the Saltzman Creek delta area and riverbank soil sampling is scheduled for the week of Oct. 19, 2015. I approve these aspects of the Supplemental Source Control Evaluation Workplan which include modifications made through written comments and our phone discussion.

Sincerely,  
Ken
